

Summary report: COG-UK geographic coverage of SARS-CoV-2 sample sequencing

Report on the week commencing on 4 January 2021 (week 01)

This report was generated on 2 February 2021 using data downloaded on 31 January 2021

COG-UK captures SARS-CoV-2 samples from COVID-19 infections across the UK, and this summary includes information on sequencing coverage across the UK. Coverage is defined as the number of sequences available in COG-UK out of the number of people with a COVID-19 infection.

In the week commencing on 4 January 2021 (week 01), 214,978 sequences out of 3,177,733 infected people (6.8%) passed basic quality checks and were available in Medical Research Council Cloud Infrastructure for Microbial Bioinformatics (MRC CLIMB-COVID, the central computational infrastructure for COG-UK).

This is an operational report – please interpret the results with caution due to the following limitations:

- Geographic information is currently lacking for ~8% of sequences which may result in apparent low coverage in some areas
- For a minority of numerator sequences, there may be more than one sequence per individual (i.e. no deduplication); this can lead to mismatches because the denominator includes the total number of infected people, not the number of samples
- Coverage proportion by Pillar is currently not available for all countries but will be included in the report as soon as available. Frequency of sequences by Pillar is shown in the table below

Table 1: Coverage, overall and by Pillar in the week commencing on 4 January 2021 (week 01)

	Overall coverage		Pillar 1 frequency		Pillar 2 frequency	
	Cumulative	Week	Cumulative	Week	Cumulative	Week
UK	214,978 (6.8%)	12,135 (3.3%)	96,425	4,697	118,553	7,438
Wales	27,267 (15.7%)	1,484 (11.8%)	23,821	1,211	3,446	273
Scotland	15,893 (10.4%)	577 (3.9%)	9,274	143	6,619	434
England	168,916 (6.1%)	9,949 (3.0%)	61,157	3,218	107,759	6,731
Northern Ireland	2,902 (3.3%)	125 (1.3%)	2,173	125	729	0

Cumulative coverage is the total number of sequences out of all COVID-19 infections. Week coverage is the number of sequences collected in the week of interest out of all infections reported in the same week. Pillar 1 includes NHS diagnostic labs. Pillar 2 includes lighthouse labs network and other large-scale diagnostic testing capacity.
